Virtual Memory: Systems

CSE251: System Programming 22nd Lecture, May. 27, 2019

Instructor:

Hyungon Moon

Today

- Address translation
- Simple memory system example
- Case study: Core i7/Linux memory system

VM Address Translation

- Virtual Address Space
 - *V* = {0, 1, ..., N−1}
- Physical Address Space
 - $P = \{0, 1, ..., M-1\}$
- Address Translation
 - MAP: $V \rightarrow P \cup \{\emptyset\}$
 - For virtual address a:
 - MAP(a) = a' if data at virtual address a is at physical address a' in P
 - $MAP(a) = \emptyset$ if data at virtual address a is not in physical memory
 - Either invalid or stored on disk

Summary of Address Translation Symbols

Basic Parameters

- N = 2ⁿ: Number of addresses in virtual address space
- M = 2^m: Number of addresses in physical address space
- **P** = **2**^p : Page size (bytes)

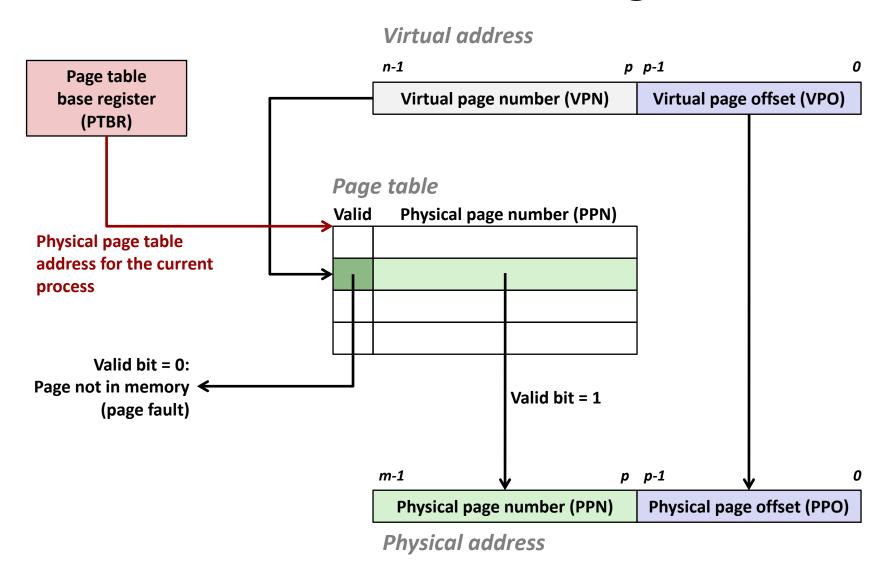

Components of the virtual address (VA)

- TLBI: TLB index
- TLBT: TLB tag
- VPO: Virtual page offset
- VPN: Virtual page number

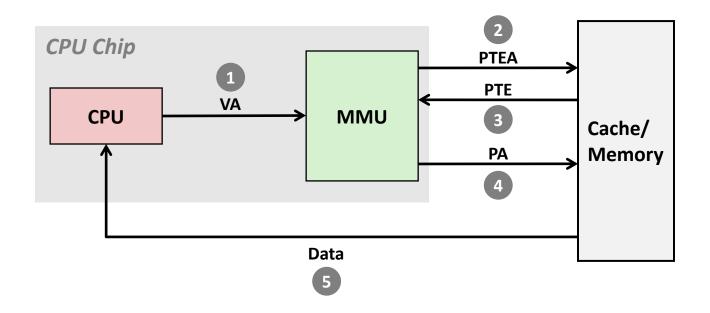

Components of the physical address (PA)

- PPO: Physical page offset (same as VPO)
- PPN: Physical page number

Address Translation With a Page Table

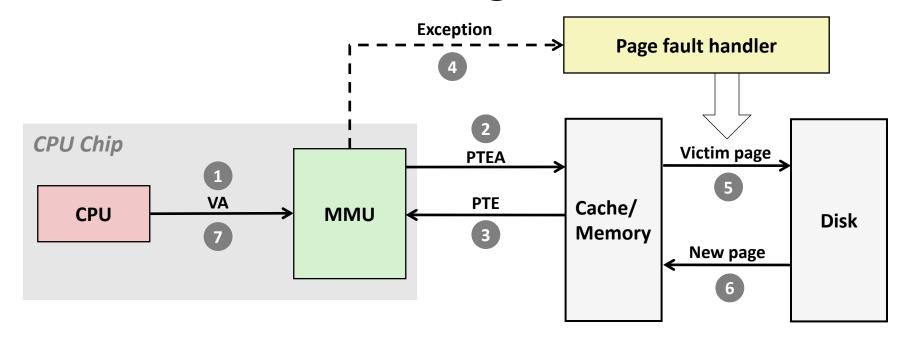

Address Translation: Page Hit

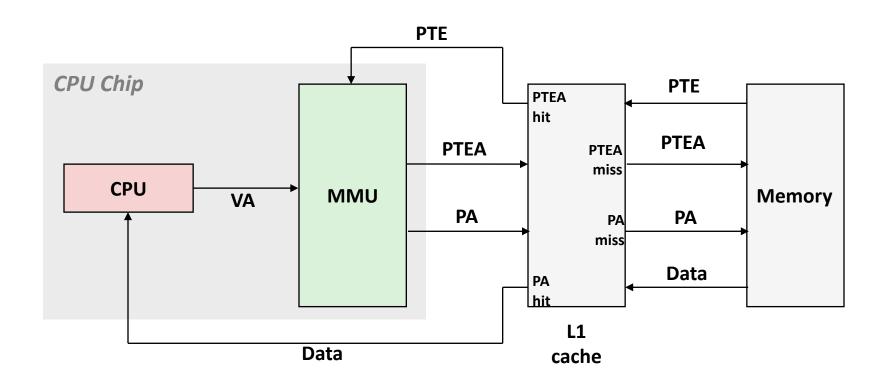

- 1) Processor sends virtual address to MMU
- 2-3) MMU fetches PTE from page table in memory
- 4) MMU sends physical address to cache/memory
- 5) Cache/memory sends data word to processor

Address Translation: Page Fault

- 1) Processor sends virtual address to MMU
- 2-3) MMU fetches PTE from page table in memory
- 4) Valid bit is zero, so MMU triggers page fault exception
- 5) Handler identifies victim (and, if dirty, pages it out to disk)
- 6) Handler pages in new page and updates PTE in memory
- 7) Handler returns to original process, restarting faulting instruction

Integrating VM and Cache

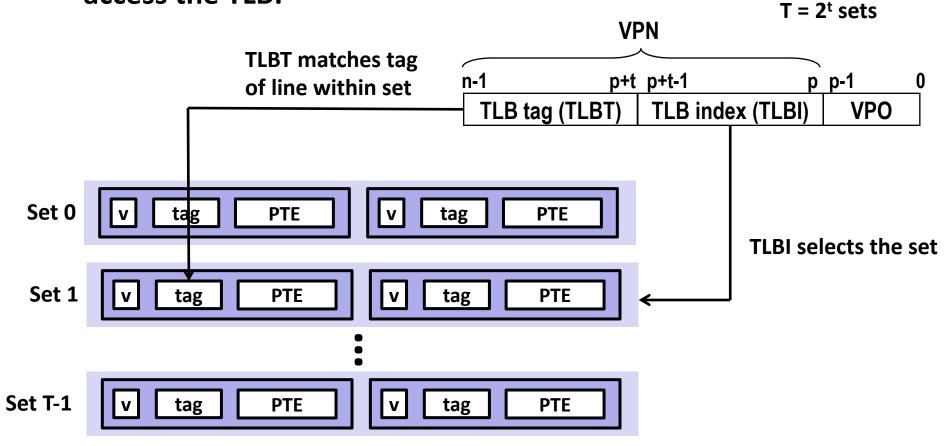

VA: virtual address, PA: physical address, PTE: page table entry, PTEA = PTE address

Speeding up Translation with a TLB

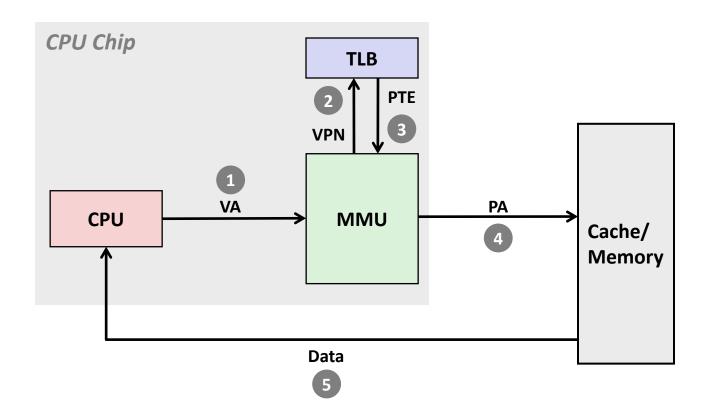

- Page table entries (PTEs) are cached in L1 like any other memory word
 - PTEs may be evicted by other data references
 - PTE hit still requires a small L1 delay
- Solution: Translation Lookaside Buffer (TLB)
 - Small set-associative hardware cache in MMU
 - Maps virtual page numbers to physical page numbers
 - Contains complete page table entries for small number of pages

Accessing the TLB

MMU uses the VPN portion of the virtual address to access the TLB:

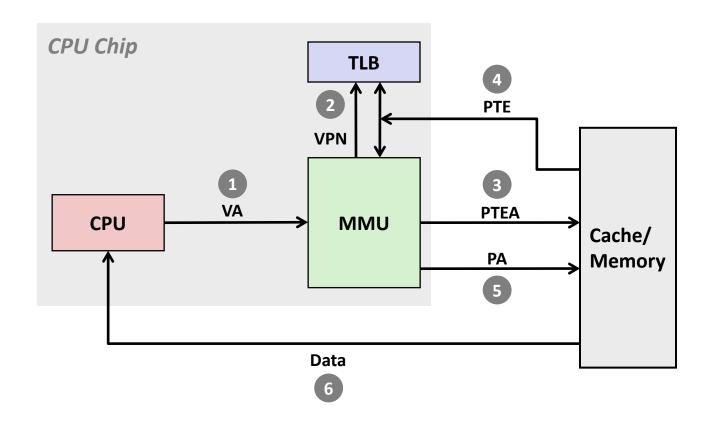

TLB Hit

A TLB hit eliminates a memory access

TLB Miss

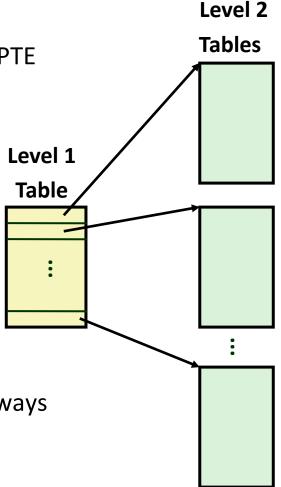

A TLB miss incurs an additional memory access (the PTE)

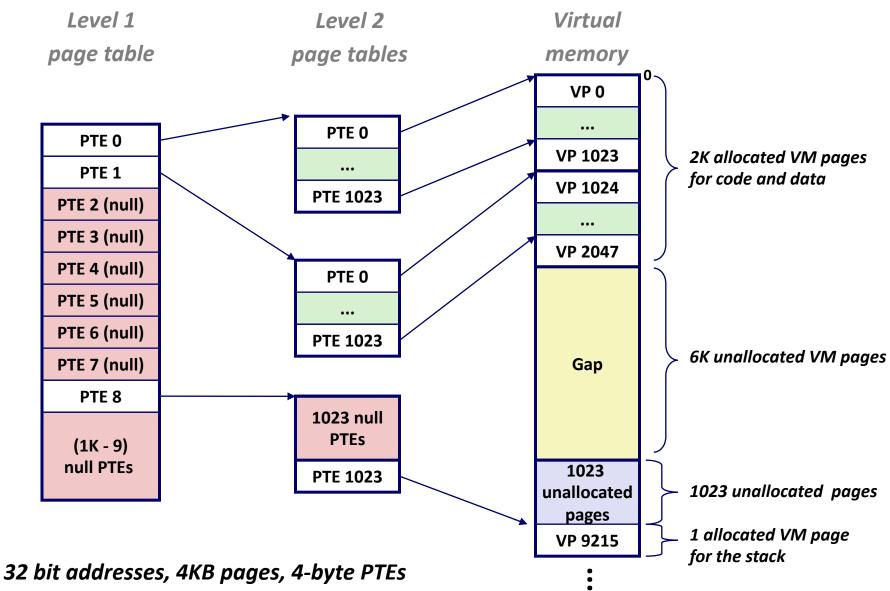

Fortunately, TLB misses are rare. Why?

Multi-Level Page Tables

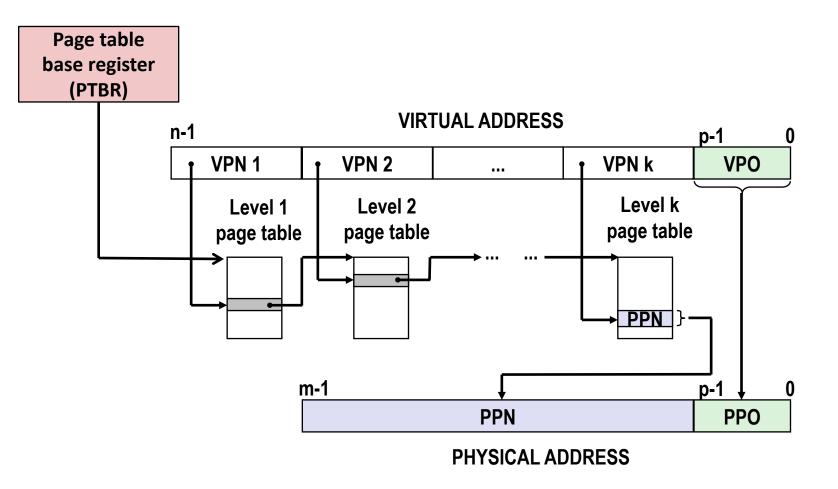

- Suppose:
 - 4KB (2¹²) page size, 48-bit address space, 8-byte PTE
- Problem:
 - Would need a 512 GB page table!
 - $2^{48} * 2^{-12} * 2^3 = 2^{39}$ bytes
- Common solution: Multi-level page table
- Example: 2-level page table
 - Level 1 table: each PTE points to a page table (always memory resident)
 - Level 2 table: each PTE points to a page (paged in and out like any other data)

A Two-Level Page Table Hierarchy

Translating with a k-level Page Table

Today

- Address translation
- Simple memory system example
- Case study: Core i7/Linux memory system

Review of Symbols

Basic Parameters

- N = 2ⁿ: Number of addresses in virtual address space
- M = 2^m: Number of addresses in physical address space
- **P** = **2**^p : Page size (bytes)

Components of the virtual address (VA)

- TLBI: TLB index
- TLBT: TLB tag
- VPO: Virtual page offset
- VPN: Virtual page number

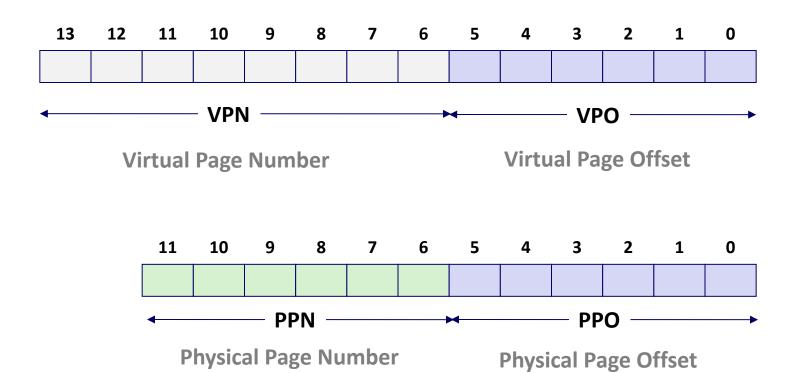

Components of the physical address (PA)

- PPO: Physical page offset (same as VPO)
- PPN: Physical page number
- CO: Byte offset within cache line
- CI: Cache index
- CT: Cache tag

Simple Memory System Example

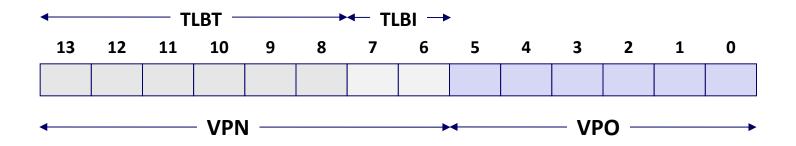

Addressing

- 14-bit virtual addresses
- 12-bit physical address
- Page size = 64 bytes

1. Simple Memory System TLB

- 16 entries
- 4-way associative

Set	Tag	PPN	Valid									
0	03	_	0	09	0D	1	00	_	0	07	02	1
1	03	2D	1	02	_	0	04	_	0	0A	_	0
2	02	_	0	08	_	0	06	_	0	03	_	0
3	07	_	0	03	0D	1	0A	34	1	02	_	0

2. Simple Memory System Page Table

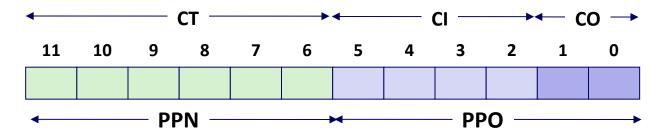

Only show first 16 entries (out of 256)

VPN	PPN	Valid
00	28	1
01	1	0
02	33	1
03	02	1
04	1	0
05	16	1
06	-	0
07	_	0

VPN	PPN	Valid	
08	13	1	
09	17	1	
0A	09	1	
ОВ	_	0	
ОС	_	0	
0D	2D	1	
0E	11	1	
OF	0D	1	

3. Simple Memory System Cache

- 16 lines, 4-byte block size
- Physically addressed
- Direct mapped

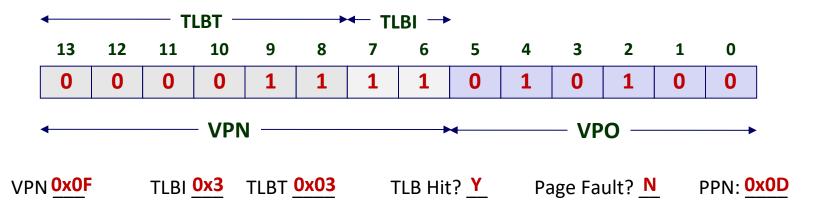

Idx	Tag	Valid	В0	B1	B2	В3
0	19	1	99	11	23	11
1	15	0	_	_	_	_
2	1B	1	00	02	04	08
3	36	0	_	-	_	_
4	32	1	43	6D	8F	09
5	0D	1	36	72	F0	1D
6	31	0	_	_	_	_
7	16	1	11	C2	DF	03

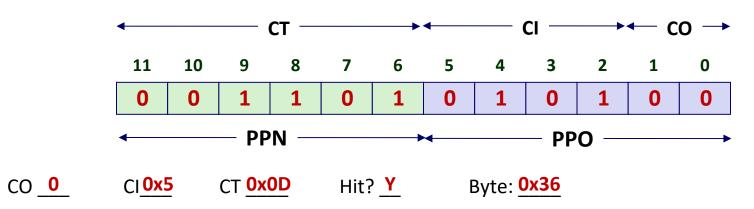

Idx	Tag	Valid	B0	B1	B2	В3
IUX	rug	vullu	ВО	DI	DZ	DJ
8	24	1	3A	00	51	89
9	2D	0	_	-	-	_
Α	2D	1	93	15	DA	3B
В	0B	0	-	-	-	_
С	12	0	_	-	-	_
D	16	1	04	96	34	15
E	13	1	83	77	1B	D3
F	14	0	_	-	_	_

Address Translation Example #1

Virtual Address: 0x03D4

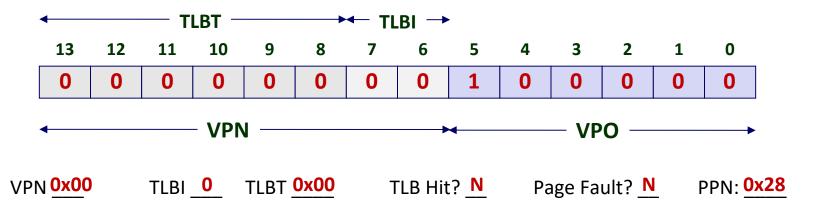

Physical Address

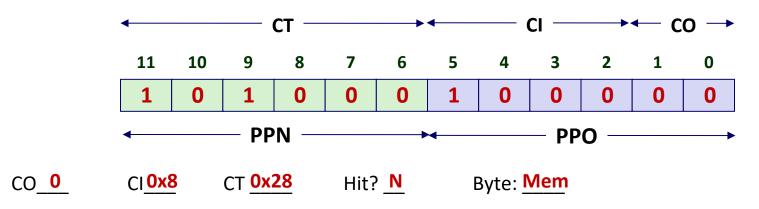

Address Translation Example #2

Virtual Address: 0x0020

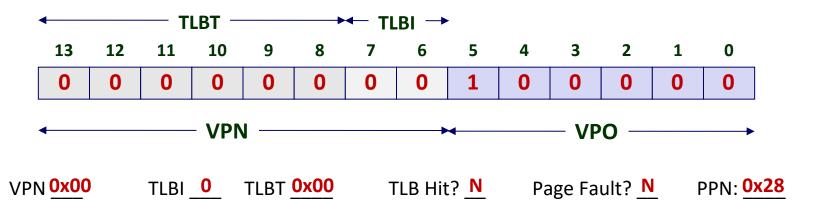

Physical Address

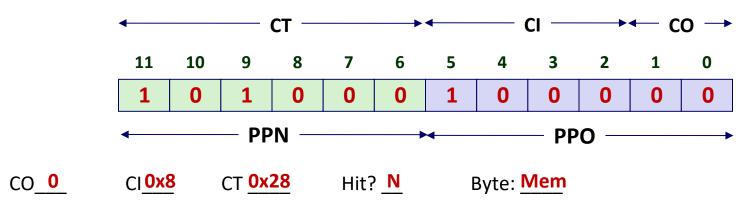

Address Translation Example #3

Virtual Address: 0x0020

Physical Address

Intel Core i7 Memory System

Processor package

Review of Symbols

Basic Parameters

- N = 2ⁿ: Number of addresses in virtual address space
- M = 2^m: Number of addresses in physical address space
- **P** = **2**^p : Page size (bytes)

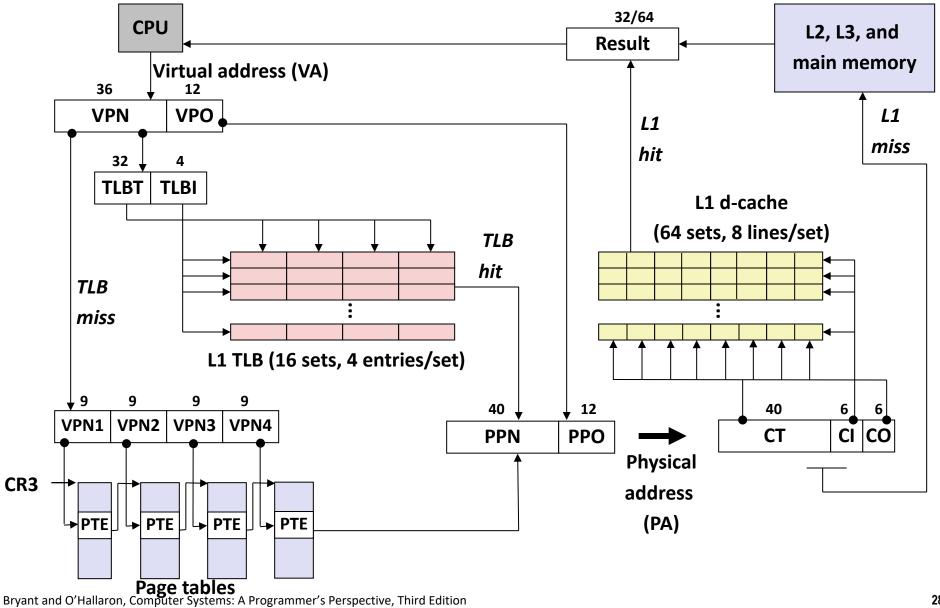

Components of the virtual address (VA)

- TLBI: TLB index
- TLBT: TLB tag
- VPO: Virtual page offset
- VPN: Virtual page number

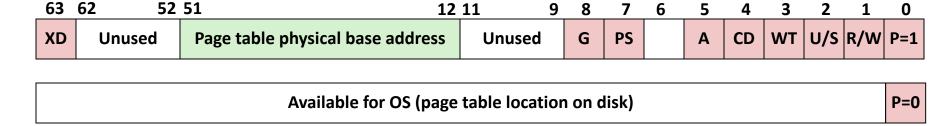

Components of the physical address (PA)

- PPO: Physical page offset (same as VPO)
- PPN: Physical page number
- CO: Byte offset within cache line
- CI: Cache index
- CT: Cache tag

End-to-end Core i7 Address Translation

Core i7 Level 1-3 Page Table Entries

Each entry references a 4K child page table. Significant fields:

P: Child page table present in physical memory (1) or not (0).

R/W: Read-only or read-write access access permission for all reachable pages.

U/S: user or supervisor (kernel) mode access permission for all reachable pages.

WT: Write-through or write-back cache policy for the child page table.

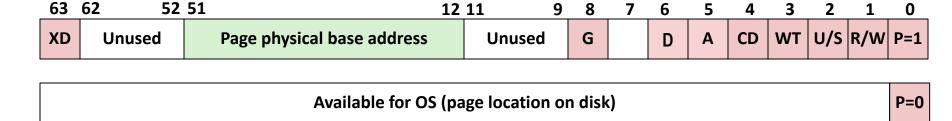

A: Reference bit (set by MMU on reads and writes, cleared by software).

PS: Page size either 4 KB or 4 MB (defined for Level 1 PTEs only).

Page table physical base address: 40 most significant bits of physical page table address (forces page tables to be 4KB aligned)

XD: Disable or enable instruction fetches from all pages reachable from this PTE.

Core i7 Level 4 Page Table Entries

Each entry references a 4K child page. Significant fields:

P: Child page is present in memory (1) or not (0)

R/W: Read-only or read-write access permission for child page

U/S: User or supervisor mode access

WT: Write-through or write-back cache policy for this page

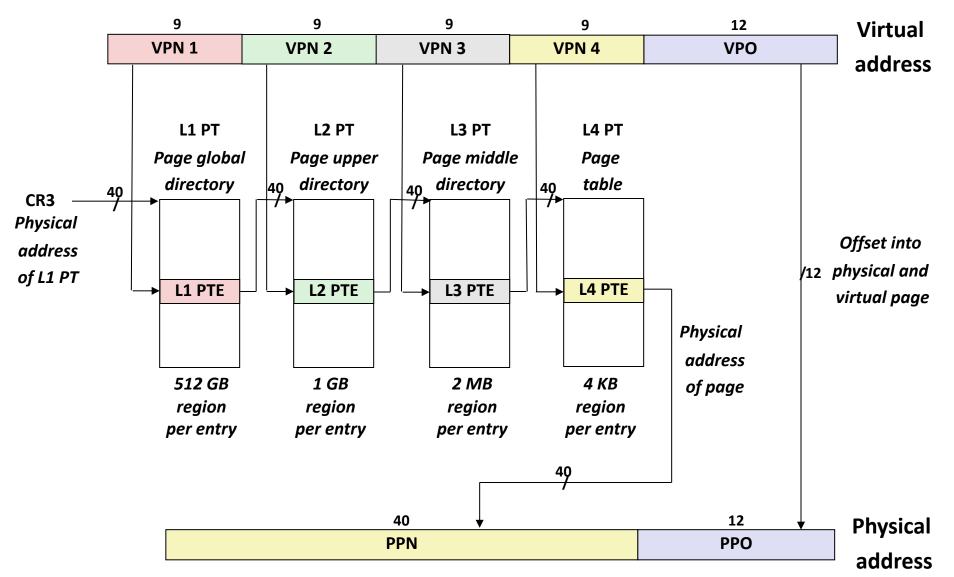

A: Reference bit (set by MMU on reads and writes, cleared by software)

D: Dirty bit (set by MMU on writes, cleared by software)

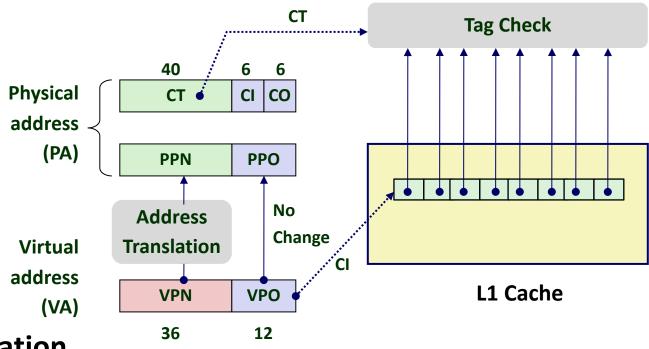

Page physical base address: 40 most significant bits of physical page address (forces pages to be 4KB aligned)

XD: Disable or enable instruction fetches from this page.

Core i7 Page Table Translation

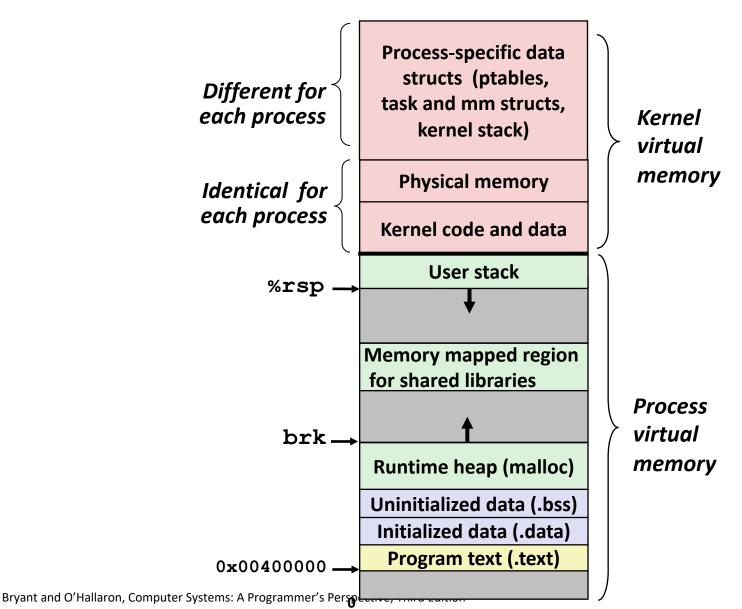

Cute Trick for Speeding Up L1 Access

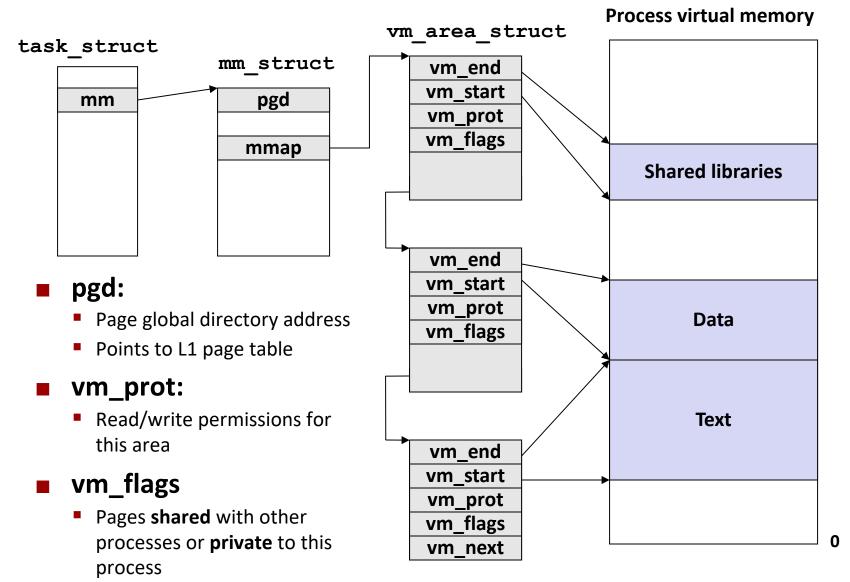

Observation

- Bits that determine CI identical in virtual and physical address
- Can index into cache while address translation taking place
- Generally we hit in TLB, so PPN bits (CT bits) available next
- "Virtually indexed, physically tagged"
- Cache carefully sized to make this possible

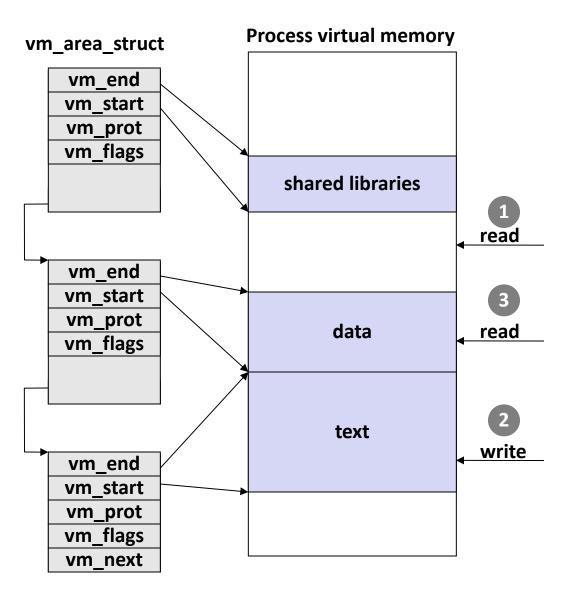

Virtual Address Space of a Linux Process

Linux Organizes VM as Collection of "Areas"

Linux Page Fault Handling

Segmentation fault:

accessing a non-existing page

Normal page fault

Protection exception:

e.g., violating permission by writing to a read-only page (Linux reports as Segmentation fault)
